

Java Angular: Todo-List App

This application is a very basic todo-list app. The app implements the following classic CRUD operations:

- Create a task in the todo list.
- Edit a task in the todo list.
- Delete a task from the todo list.
- Retrieve a task from the todo list.
- Retrieve all tasks from the todo list.

The application is protected by an authentication page, only the user in question can see their tasks.

There is a quite simplistic home page, followed by a todo page.

Finally, you can log out using the logout button in the header banner.
